Anwendungsbeschreibung	Antazoline (2508-72-7) displays neuroprotective effects against hypoxia-induced death in neuronal cultures, the mechanism of action being inhibition of NMDA currents (IC ₅₀ =4 µM). ¹ It induces concentration-dependent stimulation of insulin secretion in rat pancreas which is mediated via imidazoline I1 receptors. ² It also acts as a histamine H1 receptor antagonist (K _i =38.4 nM, human recombinant H1 receptor) ³ and was found to be a highly effective antiarrhythmic agent ⁴ .
