| Kategorie                | Kits/Assays                                                                                                                                                                                                                                                   |
| Produktbeschreibung      | The baseScribe Mod Cap1 Kits enable the efficient production of Cap1-capped, pseudouridine- or N1-methylpseudouridine-modified mRNA by in vitro transcription (IVT) from DNA templates containing a T7 RNA polymerase promoter. The kits are designed for ... |
| Anwendungsbeschreibung   | Protein expression studies Functional mRNA research in vitro and in vivo Development and evaluation of modified mRNA constructs RNA engineering and chemical biology workflows                                                                                |
