Application Notes	IFN-gamma is a dimerized soluble cytokine that is the only member of the type II class of interferons. The importance of IFNgamma in the immune system stems in part from its ability to inhibit viral replication directly, and most importantly from its immunostimulatory and immunomodulatory effects. As reported, IFNgamma is an important activator of human monocytic THP-1 cells. Therefore, THP-1 cells were incubated in RPMI-1640 with various concentration of IFN-gamma, then cells were observed by inverted microscope everyday. After stimulated with IFN-gamma (2 ng/ml) for 5 days, morphological changes occurred in THP-1 cells which displayed the shape of fusiform or polygon and were more likely to adhere.
