Application Notes	Quinacrine is an antiprotozoan drug used for malaria and giardiasis and has recently been investigated in treating lupus, as an anticancer agent, inflammation, and as a female sterilization agent.¹ It has been found to have synergistic effects with vorinostat in the treatment of T-cell acute lymphoblastic leukemia via mitophagy blockage and an increase in ROS.² Quinacrine displayed antitumor effects in an intestinal cancer mouse model and HCT116 p53^{-/-} xenografts via reduction in Chk1/2 expression and cell death induction in the G2-M phase.³ It promotes autophagic cell death in ovarian cancer cells via downregulation of p62/SQSTM1.⁴ Quinacrine is also an inhibitor of phospholipase A2.⁵
